RETROVIRAL PROTEASE INHIBITORS

This application is a continuation-in-part of
5 U. S. Patent Application Serial No. 07/615,210, filed
November 19, 1990.

BACKGROUND OF THE INVENTION1. Field of the Invention

The present invention relates to retroviral
10 protease inhibitors and, more particularly, relates to
novel compounds and a composition and method for
inhibiting retroviral proteases. This invention, in
particular, relates to urea-containing hydroxyethylamine
protease inhibitor compounds, a composition and method
15 for inhibiting retroviral proteases such as human
immunodeficiency virus (HIV) protease and for treating a
retroviral infection, e.g., an HIV infection. The
subject invention also relates to processes for making
such compounds as well as to intermediates useful in
20 such processes.

2. Related Art

During the replication cycle of retroviruses,
gag and gag-pol gene products are translated as
proteins. These proteins are subsequently processed by
25 a virally encoded protease (or proteinase) to yield
viral enzymes and structural proteins of the virus core.
Most commonly, the gag precursor proteins are processed
into the core proteins and the pol precursor proteins
are processed into the viral enzymes, e.g., reverse
30 transcriptase and retroviral protease. It has been
shown that correct processing of the precursor proteins
by the retroviral protease is necessary for assembly of
infectious virions. For example, it has been shown that
frameshift mutations in the protease region of the pol
35 gene of HIV prevents processing of the gag precursor
protein. Thus, attempts have been made to inhibit viral
replication by inhibiting the action of retroviral
proteases.

Retroviral protease inhibition typically involves a transition-state mimetic whereby the retroviral protease is exposed to a mimetic compound which binds (typically in a reversible manner) to the enzyme in competition with the gag and gag-pol proteins to thereby inhibit replication of structural proteins and, more importantly, the retroviral protease itself. In this manner, retroviral proteases can be effectively inhibited.

Several classes of mimetic compounds have been proposed, particularly for inhibition of proteases, such as for inhibition of HIV protease. Such mimetics include hydroxyethylamine isosteres and reduced amide isosteres. See, for example, EP O 346 847; EP O 342,541; Roberts et al, "Rational Design of Peptide-Based Proteinase Inhibitors, "Science, 248, 358 (1990); and Erickson et al, "Design Activity, and 2.8Å Crystal Structure of a C₂ Symmetric Inhibitor Complexed to HIV-1 Protease," Science, 249, 527 (1990).

Several classes of mimetic compounds are known to be useful as inhibitors of the proteolytic enzyme renin. See, for example, U.S. No. 4,599,198; U.K. 2,184,730; G.B. 2,209,752; EP O 264 795; G.B. 2,200,115 and U.S. SIR H725. Of these, G.B. 2,200,115, GB 2,209,752, EP O 264,795, U.S. SIR H725 and U.S. 4,599,198 disclose urea-containing hydroxyethylamine renin inhibitors. However, it is known that, although renin and HIV proteases are both classified as aspartyl proteases, compounds which are effective renin inhibitors generally cannot be predicted to be effective HIV protease inhibitors.

BRIEF DESCRIPTION OF THE INVENTION

The present invention is directed to virus inhibiting compounds and compositions. More particularly, the present invention is directed to retroviral protease inhibiting compounds and compositions, to a method of inhibiting retroviral proteases, to processes for preparing the compounds and

to intermediates useful in such processes. The subject compounds are characterized as urea-containing hydroxyethylamine inhibitor compounds.

utilizing the following general procedure. An N-
protected chloroketone derivative of an amino acid
having the formula:

10

15

wherein P represents an amino protecting group, and R² is
20 as defined above, is reduced to the corresponding
alcohol utilizing an appropriate reducing agent.
Suitable amino protecting groups are well known in the
art and include carbobenzoxy, butyryl, t-butoxycarbonyl,
acetyl, benzoyl and the like. A preferred amino
25 protecting group is carbobenzoxy. A preferred N-
protected chloroketone is N-benzyloxycarbonyl-L-

agent is sodium borohydride. The reduction reaction is
conducted at a temperature of from -10°C to about 25°C,
30 preferably at about 0°C, in a suitable solvent system
such as, for example, tetrahydrofuran, and the like.
The N-protected chloroketones are commercially available
from Bachem, Inc., Torrance, California. Alternatively,
the chloroketones can be prepared by the procedure set
35 forth in S. J. Fittkau, J. Prakt. Chem., 315, 1037
(1973), and subsequently N-protected utilizing
procedures which are well known in the art.

The resulting alcohol is then reacted,
preferably at room temperature, with a suitable base in
40 a suitable solvent system to produce an N-protected
amino epoxide of the formula:

10

The reaction can be conducted over a wide range of temperatures, e.g., from about 10°C to about 100°C, but is preferably, but not necessarily, conducted at a temperature at which the solvent begins to reflux. Suitable solvent systems include those wherein the solvent is an alcohol, such as methanol, ethanol, isopropanol, and the like, ethers such as tetrahydrofuran, dioxane and the like, and toluene, N,N-dimethylformamide, dimethyl sulfoxide, and mixtures thereof.  35 like is prepared by reacting a carbonyldiimidazole with an amine salt, e.g., the hydrochloride salt of a compound represented by the formula:

40

in a suitable solvent such as, for example, chloroform. The resulting product is then reacted with the salt,

such as, for example, the hydrochloride salt, of the amino alcohol described above. The corresponding sulfur analogs can be utilized where Y of Formula II is S.

35 base, such as triethylamine, diisopropylamine and the like in a suitable solvent such as toluene, methylene chloride, chloroform or tetrahydrofuran. Alternatively, one can generate the isocyanate in situ by the Curtius rearrangement of a carboxylic acid of the formula:

40

45

5

10

by an appropriate method. One such method is by the reaction of the carboxylic acid with diphenylphosphoryl azide in the presence of a suitable base, such as triethylamine, N-methylmorpholine or diisopropylethylamine, in a suitable solvent such as toluene, methylene chloride, chloroform and tetrahydrofuran and the like.

20

25

30

by deprotonation with a strong base, such as lithium diisopropyl amide or lithium hexamethyldisilazide, in a suitable solvent such as tetrahydrofuran and react the anion or dianion with an electrophilic reagent of the formula:

40

45

where X is an appropriate leaving group such as chloride, bromide, iodide, methanesulfonyl, p-

toluenesulfonyl or trifluoromethanesulfonyl and the like.

5

10

20 where P' is a suitable acid protecting groups such as methyl, ethyl, isopropyl, benzyl, tertiary-butyl, trimethylsilyl, t-butyldimethylsilyl, and the like, with appropriate electrophiles;

25 where R⁷, R^{7'} and X are as defined above, in the presence of a suitable base such as sodium hydride, potassium hydride, sodium alkoxide or potassium alkoxide. Suitable alkoxides being methoxide, ethoxide, isopropoxide and tertiary-butoxide and the like. The
30 reaction is carried out in a suitable solvent such as tetrahydrofuran, N,N-dimethylformamide or an alcohol solvent, such as methanol, ethanol, isopropanol or tertiary-butanol. The reaction with R⁷ and R^{7'} can be done sequentially if R⁷ and R^{7'} are different, or
35 simultaneously if R⁷ and R^{7'} are identical or form a cyclic ring during the alkylation step. The resulting product is a mono- or di-substituted malonate diester of the formula:

In order to generate the carboxylic acid required for the Curtius rearrangement, the acid protecting group P' is selectively removed. Suitable methods for removal are (1) hydrolysis with lithium hydroxide, sodium hydroxide, potassium hydroxide and the like, (2) acidolysis with an acid such as hydrochloric acid, hydrobromic acid, trifluoroacetic acid and the like, and (3) hydrogenolysis with hydrogen in the presence of a suitable catalyst such as palladium-on-carbon. The resulting carboxylic acid has the formula:

30

In the case where R⁸ is an amino group NR¹⁶R¹⁷, the amino group can be introduced either by displacement of an appropriate leaving group or reductive amination with an appropriate aldehyde. The displacement of the leaving group from an ester of the formula:

40

45

where P' and X are as defined above, can be readily accomplished by one skilled in the art. The protecting

20

group P' is then removed by the methods discussed above to provide the required carboxylic acid of the formula:

10

The reductive amination procedure is readily accomplished by the reaction of an aldehyde of the formula:

with the amine $\text{HNR}^{16}\text{R}^{17}$ in the presence of sodium cyanoborohydride or hydrogen and a suitable catalyst, such as palladium-on-carbon, and the acid protecting group P' is removed by the methods discussed above. The required aldehydes can be prepared by a number of methods well-known to those in the art. Such methods include reduction of an ester, oxidation of an alcohol or ozonolysis of an olefin.

In the case where R^8 is a keto-group and t is 0, one can mono- or dialkylate an ester of acetoacetic acid of the formula:

10

as described above for the malonate diesters to provide a compound of the formula:

15

20

25

The acid protecting group can be removed to provide the desired carboxylic acid for the Curtius rearrangement, or the ketone can be converted to a ketal, such as the dimethyl ketal, diethyl ketal or ethylene glycol ketal, by reaction with the appropriate alcohol in the presence of a suitable acid, such as p-toluenesulfonic acid or the like, and a dehydrating agent such as trimethyl- or triethylorthoformate to provide, for example, a compound of the following formula:

40

45

The protecting group P' can then be removed to provide a compound of the formula:

15

which is suitable for the Curtius rearrangement. If desired, the ketal group can be converted at any time during the subsequent synthesis to the corresponding ketone by hydrolysis in the presence of an acid such as aqueous hydrochloric acid.

The urea derivative of the amino alcohol, and the corresponding sulfur analog, are novel intermediates and can be represented by the formula:

25

30

35

Following preparation of the urea derivative, or corresponding analogs wherein Y is S, the amino protecting group P is removed under conditions which will not affect the remaining portion of the molecule. These methods are well known in the art and include acid hydrolysis, hydrogenolysis and the like. A preferred method involves removal of the protecting group, e.g., removal of a carbobenzoxy group, by hydrogenolysis utilizing palladium on carbon in a suitable solvent system such as an alcohol, acetic acid, and the like or

mixtures thereof. Where the protecting group is a t-butoxycarbonyl group, it can be removed utilizing an inorganic or organic acid, e.g., HCl or trifluoroacetic acid, in a suitable solvent system, e.g., dioxane or methylene chloride. The resulting product is the amine salt derivative. Following neutralization of the salt, the amine is then reacted with an amino acid or corresponding derivative thereof represented by the formula $(\text{PN}[\text{CR}^{\text{I}'}\text{R}^{\text{I}''}]\text{CH}(\text{R}^{\text{I}})\text{COOH})$ wherein t, R^{I} , $\text{R}^{\text{I}'}$, and $\text{R}^{\text{I}''}$ are as defined above, to produce the antiviral compounds of the present invention having the formula:

20

wherein t, B, P, R^{I} , $\text{R}^{\text{I}'}$, $\text{R}^{\text{I}''}$, R^{II} , R^{III} , R^{IV} , and Y are as defined above. Preferred protecting groups in this instance are a benzyloxycarbonyl group or a t-butoxycarbonyl group. Where the amine is reacted with a derivative of an amino acid, e.g., when t=1 and $\text{R}^{\text{I}'}$ and $\text{R}^{\text{I}''}$ are both H, so that the amino acid is a β -amino acid, such β -amino acids can be prepared according to the procedure set forth in a copending application, U. S. Serial No. 07/345,808. Where t is 1, one of $\text{R}^{\text{I}'}$ and $\text{R}^{\text{I}''}$ is H and R^{I} is hydrogen so that the amino acid is a homo- β -amino acid, such homo- β -amino acids can be prepared by the same procedure. Where t is 0 and R^{I} is alkyl, cycloalkyl, $-\text{CH}_2\text{SO}_2\text{NH}_2$ or an amino acid side chain, such materials are well known and many are commercially available from Sigma-Aldrich.

The N-protecting group can be subsequently removed, if desired, utilizing the procedures described above, and then reacted with a carboxylate represented by the formula:

10 wherein R is as defined above and L is an appropriate
leaving group such as a halide. Preferably, when R¹ is a
side chain of a naturally occurring α-amino acid, R is a
2-quinoline carbonyl group derived from N-
hydroxysuccinimide-2-quinoline carboxylate, i.e., L is
15 hydroxy succinimide or R is a 2-benzofuroyl (2-
benzofurancarbonyl) derived from benzofuran-2-carboxylic
acid. A solution of the free amine (or amine acetate
salt) and about 1.0 equivalent of the carboxylate are
mixed in an appropriate solvent system and optionally
20 treated with up to five equivalents of a base such as,
for example, N-methylmorpholine, at about room
temperature. Appropriate solvent systems include
tetrahydrofuran, methylene chloride or N,N-
dimethylformamide, and the like, including mixtures
25 thereof.

Alternatively, the protected amino alcohol from the epoxide opening can be further protected at the newly introduced amino group with a protecting group P' which is not removed when the first protecting P is removed. One skilled in the art can choose appropriate combinations of P and P'. One suitable choice is when P is Cbz and P' is Boc. The resulting compound represented by the formula:

10

15

20

can be carried through the remainder of the synthesis to provide a compound of the formula:

25

30

35

and the new protecting group P' is selectively removed, and following deprotection, the resulting amine reacted to form the urea derivative as described above. This selective deprotection and conversion to the urea can be accomplished at either the end of the synthesis or at any appropriate intermediate step if desired. This alternate procedure is also suitable for producing compounds at formulas III-VI.

45

Preparation of Compounds of Formula III

A mercaptan of the formula R'SH is reacted with a substituted methacrylate of the formula:

26

5

10

by way of a Michael Addition. The Michael Addition is conducted in a suitable solvent and in the presence of a suitable base, to produce the corresponding thiol derivative represented by the formula:

20

25

wherein R and R¹ represent radicals defined above; R²⁰ and R²¹ represent hydrogen and radicals as defined for R¹; and R²² represents radicals as defined by R³.

Suitable solvents in which the Michael Addition can be conducted include alcohols such as, for example, methanol, ethanol, butanol and the like, as well as ethers, e.g., THF, and acetonitrile, DMF, DMSO, and the like, including mixtures thereof. Suitable bases include Group I metal alkoxides such as, for example sodium methoxide, sodium ethoxide, sodium butoxide and the like as well as Group I metal hydrides, such as sodium hydride, including mixtures thereof.

The thiol derivative is converted into the corresponding sulfone of the formula:

45

5

10 by oxidizing the thiol derivative with a suitable
 oxidation agent in a suitable solvent. Suitable
 oxidation agents include peracids such as, for example,
 sodium meta-perborate, oxone (potassium peroxy
 monosulfate), meta-chloroperoxybenzoic acid, and the
 15 like, including mixtures thereof. Suitable solvents
 include acetic acid (for sodium meta-perborate) and, for
 other peracids, ethers such as THF and dioxane, and
 acetonitrile, DMF, DMSO, and the like, including
 mixtures thereof.

20 The sulfone is then converted to the
 corresponding free acid of the formula:

25

30 utilizing a suitable base, e.g., lithium hydroxide,
 sodium hydroxide, and the like, including mixtures
 thereof, in a suitable solvent, such as, for example,
 THF, acetonitrile, DMF, DMSO, methylene chloride and the
 35 like, including mixtures thereof.

The free acid is then coupled, utilizing, as
 described above, procedures well known in the art, to
 the urea derivative, or analog thereof, of an amino
 alcohol which is described above for the preparation of
 40 compounds of Formula II. The resulting product is a
 compound represented by Formula III.

Alternatively, one can couple the urea
 isostere to the commercially available acid,

5

10 remove the thioacetyl group with a suitable base, such
as hydroxide, or an amine, such as ammonia, and then
react the resulting thiol with an alkylating agent, such
as an alkyl halide, tosylate or mesylate to afford
compounds of the following structure:

15

20

25

The sulfur can then be oxidized to the
corresponding sulfone using suitable oxidizing agents,
as described above, to afford the desired compounds of
the following structure:

30

35

40

Alternatively, to prepare compounds of Formula III, a
substituted methacrylate of the formula:

45

50

wherein

L represents a leaving group as previously defined,
 R^{35} and R^{36} represent hydrogen and radicals as defined for
 R^1 ; and

- 5 R^{37} represents alkyl, aralkyl, cycloalkyl and
 cycloalkylalkyl radicals, is reacted with a suitable
 sulfonating agent, such as, for example, a sulfinic
 acid represented by the formula RSO_2M ,

wherein

- 10 R' represents radicals as defined above and M
 represents a metal adapted to form a salt of the
 acid, e.g., sodium, to produce the corresponding
 sulfone represented by the formula:

15

20

- wherein R' , R^{35} , R^{36} and R^{37} are as defined above. The
 25 sulfone is then hydrolyzed in the presence of a suitable
 base, such as lithium hydroxide, sodium hydride and the
 like, to the compound represented by the formula:

30

35

- wherein R , R^{35} and R^{36} represent radicals as defined
 above. The resulting compound is then asymmetrically
 hydrogenated utilizing an asymmetric hydrogenation
 40 catalyst such as, for example, a ruthenium-BINAP
 complex, to produce the reduced product, substantially
 enriched in the more active isomer, represented by the
 formula:

45

wherein R^1 , R^{35} and R^{36} represent radicals as defined above. Where the more active isomer has the R-stereochemistry, a Ru(R-BINAP) asymmetric hydrogenation catalyst can be utilized. Conversely, where the more active isomer has the S-stereochemistry, a Ru(S-BINAP) catalyst can be utilized. Where both isomers are active, or where it is desired to have a mixture of the two diastereomers, a hydrogenation catalyst such as platinum, or palladium, on carbon can be utilized to reduce the above compound. The reduced compound is then coupled to the urea isostere, as described above, to produce compounds of Formula III.

Preparation of Compounds of Formula IV

To produce compounds of Formula IV, starting with a lactate of the formula:

wherein P'' represents alkyl radicals, such as, for example, methyl, ethyl, and the like. The hydroxyl group of the lactate is protected as its ketal by reaction in a suitable solvent system with methyl isopropenyl ether (1,2-methoxypropene) in the presence of a suitable acid. Suitable solvent systems include

methylene chloride, DMF, and the like, including mixtures thereof. Suitable acids include POCl_3 , HCl , and the like. It should be noted that well-known groups other than methyl isopropenyl ether can be utilized to form the ketal. The ketal is then reduced with diisobutylaluminum hydride (DIBAL) at -78°C to produce the corresponding aldehyde which is then treated with ethylidene triphenylphosphorane (Wittig reaction) to produce a compound represented by the formula:

The ketal protecting group is then removed utilizing procedures well-known in the art such as by mild acid hydrolysis. The resulting compound is then esterified with isobutyryl chloride to produce a compound of the formula:

This compound is then treated with lithium diisopropyl amide at -78°C followed by warming of the reaction mixture to room temperature to effect a Claisen rearrangement ([3,3]) to produce the corresponding acid represented by the formula:

15 Treatment of the acid with benzyl bromide in the presence of a tertiary amine base, e.g., DBU, produces the corresponding ester which is then cleaved oxidatively to give a trisubstituted succinic acid:

30 The trisubstituted succinic acid is then coupled to the urea isostere as described above. To produce the free acid, the benzyl ester is removed by hydrogenolysis to produce the corresponding acid. The acid can then be converted to the primary amide by

35 methods well-known in the art.

 An alternative method for preparing trisubstituted succinic acids involves reacting an ester of acetoacetic acid represented by the formula:

wherein R is a suitable protecting group, such as methyl, ethyl, benzyl or t-butyl, with sodium hydride and a hydrocarbyl halide ($R^{31}X$ or $R^{32}X$) in a suitable solvent, e.g., THF, to produce the corresponding
 5 disubstituted derivative represented by the formula:

15 This disubstituted acetoacetic acid derivative is then treated with lithium diisopropyl amide at about -10°C and in the presence of $\text{PhN}(\text{triflate})_2$ to produce a vinyl triflate of the formula:

30 The vinyl triflate is then carbonylated utilizing a palladium catalyst, e.g., $\text{Pd}_2(\text{OAc})_2(\text{Ph}_3\text{P})$, in the presence of an alcohol ($\text{R}''\text{OH}$) or water ($\text{R}''=\text{H}$) and a base, e.g., triethylamine, in a suitable solvent such as
 35 DMF, to produce the olefinic ester or acid of the formula:

The olefin can then be subsequently asymmetrically hydrogenated, as described above, to produce a trisubstituted succinic acid derivative of the formula:

15

If R'' is not H, R'' can be removed by hydrolysis, acidolysis or hydrogenolysis, to afford the corresponding acid which is then coupled to the urea isostere as described above and then, optionally, the R group is removed to produce the corresponding acid, and, optionally, converted to the amide.

Alternatively, one can react the urea isostere with either a suitably monoprotected succinic acid or glutaric acid of the following structure;

35

where P is a suitable protecting group, such as benzyl or t-butyl or the like, and remove the protecting group and convert the resulting acid to an amide. One can also react an anhydride of the following structure;

45

10

with the urea isostere and separate any isomers or convert the resulting acid to an amide and separate any isomers.

It is contemplated that for preparing compounds of the Formulas having R^6 , the compounds can be prepared following the procedure set forth above and, prior to coupling the urea derivative or analog thereof to the amino acid $\text{PNH}(\text{CH}_2)_t\text{CH}(\text{R}^1)\text{COOH}$, carried through a procedure referred to in the art as reductive amination. Thus, a sodium cyanoborohydride and an appropriate aldehyde $\text{R}^6\text{C}(\text{O})\text{H}$ or ketone $\text{R}^6\text{C}(\text{O})\text{R}^6$ can be reacted with the urea derivative compound or appropriate analog at room temperature in order to reductively aminate any of the compounds of Formulas I-VI. It is also contemplated that where R^3 of the amino alcohol intermediate is hydrogen, the inhibitor compounds can be prepared through reductive amination of the final product of the reaction between the amino alcohol and the amine or at any other stage of the synthesis for preparing the inhibitor compounds.

Contemplated equivalents of the general formulas set forth above for the antiviral compounds and derivatives as well as the intermediates are compounds otherwise corresponding thereto and having the same general properties wherein one or more of the various R groups are simple variations of the substituents as defined therein, e.g., wherein R is a higher alkyl group than that indicated. In addition, where a substituent is designated as, or can be, a hydrogen, the exact chemical nature of a substituent which is other than hydrogen at that position, e.g., a hydrocarbyl radical

or a halogen, hydroxy, amino and the like functional group, is not critical so long as it does not adversely affect the overall activity and/or synthesis procedure.

25 removed by a stream of N₂, dimethylsulfide (10 ml) was
added, and the reaction mixture was allowed to warm to
room temperature and stirred for 56 h. After the
removal of solvents, the residue was dissolved in Et₂O
(50 ml) and washed with H₂O (15 ml) then sat. NaCl

acetic acid (2 ml) at 0°C. To this cold solution was
added N-methylpiperizine (2.5g, 25 mmol) slowly at 0°C.
The reaction mixture was stirred at 0°C for 2 h and room

temperature for 16 h. The removal of solvents gave a solid. To the solid was added H₂O (25 ml) and ether (50 ml). The organic layer was separated and to this was added 5% HCl (25 ml). The aqueous layer was collected
5 and to this was added 2.5N NaOH until pH ~ 14, and extracted with ether (25 ml x 3). The combined organic extracts were washed with brine (15 ml), dried (Na₂SO₄) and concentrated to afford 5.5g (95%) of desired amine as an oil. This oil was hydrogenated (1.5g of 10% Pd/C,
10 50 psi H₂) in MeOH (50 ml) at room temperature for 2 h. the reaction mixture was filtered and the filtrate was concentrated to afford 4.0g (98%) of the desired amino acid as a white solid.

25 room temperature for 36 h. Diluted with 5:1 ether:petane (100 ml) and washed with H₂O (50 ml), brine (50 ml). The combined organic phases were dried (Na₂SO₄), concentrated to give 8.4g (74%) of olefin.

30 To a solution of olefin (3.45g, 20 mmol) in CH₂Cl₂ (75 ml) was bubbled through a stream of ozone at -78°C until the blue color persisted. Excess ozone was removed by a stream of N₂, dimethyl sulfide (5 ml) was added, and the reaction mixture was allowed to warm to room temperature
35 and stirred for 36 h. After removal of all solvents, the residue was dissolved in Et₂O (35 ml) and washed with H₂O (10 ml) and sat. NaCl solution (10 ml). The organic extracts were dried (Na₂SO₄), concentrated to afford 3.2g

(92%) of aldehyde. To a solution of this aldehyde (3.2g, 18.4 mmol) in MeOH (80 ml) was added Na CNBH₃ (2.3g, 36.8 mmol) and acetic acid (2 ml) at 0°C. To this cold solution was added morpholine (2g, 23 mmol) 5 slowly at 0°C and stirred for 2 h at 0°C, 16 h at room temperature. The removal of solvents gave a solid, to this solid was added H₂O (20 ml) and Et₂O (50 ml). The organic layer was separated and to this was added 5% HCl (20 ml). The aqueous layer was collected and to this 10 was added 2.5N NaOH solution until pH ~ 14, and extracted with Et₂O (25 ml x 3). The combined organic extracts were washed with brine (15 ml), dried (Na₂SO₄) and concentrated to afford 1.6g (35%) the desired amine. The amine (1.58g, 6.4 mmol) was subjected to a mixture 15 of 10% NaOH (13 ml, 32 mmol) and MeOH (10 ml) and stirred for 16 h. Acetic acid (2.5 ml, 41.6 mmol) was added and the solvents were removed in vacuo to give a solid. The solid was washed with CH₂Cl₂ (25 ml x 4). The combined CH₂Cl₂ solutions were dried (Na₂SO₄) and 20 concentrated to give an oil. The purification of the oil by plug filtration (silica gel, 20% MeOH/CH₂Cl₂ the MeOH) gave 350 mg (24%) pure amine acid as an oil.

A. Intermediates35 Preparation of 2,2-Dimethyl-3-phenylpropionic Acid

To a mixture of 1.23g (41.0 mmol) of 80% sodium hydride and 50 mL of anhydrous tetrahydrofuran under a nitrogen atmosphere, was added 3.88g (38.3 mmol) of diisopropylamine and then 3.3g (37.5 mmol) of isobutyric acid. After heating at reflux for 15 minutes and cooling to 0°C, 15 mL (37.5 mmol) of 2.5M n-butyllithium in hexane was added. The mixture was warmed to 35°C for 30 min, cooled to 0°C and 6.40g (37.5 mmol) of benzyl bromide added. The mixture was stirred for 30 minutes at 0°C, then warmed to 35°C for one hour and recooled to 0°C. Water was added and the aqueous layer extracted with diethyl ether, acidified with 6N aqueous HCl and

extracted with diethyl ether. The organic layer was dried and concentrated to provide 4.0g of crude product. Chromatography on silica gel using 10% methanol/methylene chloride afforded 1.0g of pure 2,2-dimethyl-3-phenylpropionic acid, m/e 185 (M + Li).

Under a nitrogen atmosphere, 1.23g (41 mmol) of 80% sodium hydride was added to 50 mL of anhydrous tetrahydrofuran, followed by 3.88g (38.3 mmol) of diisopropylamine. To the resulting mixture was added 3.3g (37.5 mmol) of isobutyric acid and the resulting mixture heated to reflux for 15 minutes. Upon cooling to 0°C, 15 mL (37.5 mmol) of 2.5M n-butyllithium in hexane was added and the mixture then warmed to 35°C for 30 minutes. After cooling to 0°C, 4.8g (37.5 mmol) of 4-chloromethylpyridine (freshly prepared by neutralization of the hydrochloride salt with aqueous sodium bicarbonate, extraction with hexane, dried and concentrated) was added. After 30 minutes at 0°C, the mixture was warmed to 30°C for one hour, cooled to 0°C and 50 mL of water carefully added. The aqueous layer was separated and washed twice with diethyl ether, acidified with 6N aqueous hydrochloric acid, re washed twice with diethyl ether and then neutralized with aqueous sodium bicarbonate. After the addition of citric acid, the aqueous layer was extracted 3 xs with ethyl acetate to afford 283 mg of a white powder which was identified as 2,2-dimethyl-3-(4-pyridyl)propionic acid, m/e 180 (M + H⁺).

and 45 mL of 2.5M n-butyllithium in hexane added. After 15 minutes at 0°C and 30 minutes at 35°C, the mixture was recooled to 0°C and a solution of 14.4g (112 mmol) of 4-chloromethylpyridine (freshly prepared from 4-chloromethylpyridine hydrochloride by neutralization with aqueous sodium bicarbonate, extraction with hexane, drying and concentrating) was added. After 30 minutes at 0°C and 60 minutes at 35°C, the mixture was cooled to 0°C, water carefully added and extracted twice with diethyl ether. The aqueous layer was acidified to pH3 with 6N hydrochloric acid whereupon a precipitate formed. The pH was adjusted to 5.9 with 10% sodium hydroxide and the solids collected. Recrystallization from hot ethanol and hexane afforded 5.7g of desired product, m/e 206 (M + H).

EXAMPLE 9

Additional exemplary compounds of the present invention are listed in Table 1. These compounds were prepared according to the following general procedures.

General Procedure for the Synthesis of 1,3-Diamino 4-phenyl Butan-2-ol Derivatives.

- A mixture of the amine R³NH₂ (20 equiv.) in dry isopropyl alcohol (20mL/mmol of epoxide to be converted) was heated to reflux and then treated with an N-Cbz amino epoxide of the formula:

5

10 from a solids addition funnel over a 10-15 minute
period. After the addition is complete the solution was
maintained at reflux for an additional 15 minutes and
the progress of the reaction monitored by TLC. The
reaction mixture was then concentrated in vacuo to give
15 an oil that was treated with n-hexane with rapid
stirring whereupon the ring opened material precipitated
from solution. Precipitation was generally complete
within 1 hr and the product was then isolated by
filtration on a Büchner funnel and then air dried. The
20 product was further dried in vacuo. This method affords
amino alcohols of sufficient purity for most purposes.
General procedure for the Reaction of Amino Alcohols
with Isocyanates: Preparation of Ureas

A solution from the amino alcohol in
25 tetrahydrofuran (THF) was treated at room temperature
with the appropriate isocyanate of formula R'NCO via
syringe under nitrogen. After the reaction has stirred
for ~5m the progress of the reaction was monitored by
TLC. The solvent was removed in vacuo and the product
30 obtained was of sufficient purity for most purposes.
The product may be further purified by dissolution in
ethyl acetate and washing with 5% aqueous citric acid,
water, and brine. The solvent is dried over anhydrous
magnesium sulfate, filtered and concentrated in vacuo to
35 give the pure urea.

General Procedure for the Removal of the Protecting Groups by Hydrogenolysis with Palladium on Carbon

A. Alcohol Solvent

The Cbz-protected peptide derivative was dissolved in methanol (ca. 20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is sealed and flushed 5 times with nitrogen and then 5 times with hydrogen. The pressure is maintained at 50 psig for 1-16 hours and then the hydrogen replaced with nitrogen and the solution filtered through a pad of celite to remove the catalyst. The solvent is removed in vacuo to give the free amino derivative of suitable purity to be taken directly on to the next step.

B. Acetic Acid Solvent

The Cbz-protected peptide derivative was dissolved in glacial acetic acid (20mL/mmol) and 10% palladium on carbon catalyst is added under a nitrogen atmosphere. The reaction vessel is flushed 5 times with nitrogen and 5 times with hydrogen and then maintained at 40 psig for about 2h. The hydrogen was then replaced with nitrogen and the reaction mixture filtered through a pad of celite to remove the catalyst. The filtrate was concentrated and the resulting product taken up in anhydrous ether and evaporated to dryness 3 times. The final product, the acetate salt, was dried in vacuo and is of suitable purity for subsequent conversion.

General Procedure for Removal of Boc-protecting Group with 4N Hydrochloric Acid in Dioxane

The Boc-protected amino acid or peptide is treated with a solution of 4N HCl in dioxane with stirring at room temperature. Generally the deprotection reaction is complete within 15 minutes, the progress of the reaction is monitored by thin layer chromatography (TLC). Upon completion, the excess dioxane and HCl are removed by evaporation in vacuo. The last traces of dioxane and HCl are best removed by evaporation again from anhydrous ether or acetone. The

hydrochloride salt thus obtained is thoroughly dried in vacuo and is suitable for further reaction.

EDC/HOBt Coupling of Cbz-Asparagine (General Procedure)

- N-CBZ-(L-asparagine (1.10eq) and N-
- 5 hydroxybenzotriazole (HOBt) (1.5eq) are dissolved in dry dimethylformamide (DMF) (2-5mL/mmol) and cooled in an ice bath. 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) (1.10eq) is added to the stirring solution and maintained at 0°C for 10
- 10 minutes. A solution of the amino component (free amine), 1.0eq in DMF (1-2mL/mmol), is added. [In the case of the amine hydrochloride or acetate salt, an equivalent of N-methyilmorpholine is also added.] The reaction mixture is stirred at 0°C for 1 hour and then
- 15 at room temperature for ~5-6 hours. The reaction mixture is then poured into a rapidly stirring solution of 60% saturated aqueous sodium bicarbonate (ca-50mL/mmol). An immediate white precipitate forms which is collected on a Büchner funnel and the solid washed
- 20 thoroughly with saturated aqueous sodium bicarbonate, water, 5% aqueous citric acid solution and water. The product is thoroughly dried in vacuo and redissolved in DMF, filtered and reprecipitated by the addition to water. The precipitated product is isolated by
- 25 filtration, washed again with water and dried in vacuo.

General Procedure for Acylation with 2-Quinoline Carboxylic Acid N-Hydroxysuccinimide Ester

- A solution of the free amine (or amine acetate salt) and 1.0 equivalent of N-hydroxysuccinimide 2-
- 30 quinoline carboxylate in anhydrous dichloromethane was treated with 1.5 equivalents of N-methyilmorpholine (NMM) at room temperature. The progress of the reaction was monitored by TLC and when the reaction was complete, the reaction mixture was diluted with additional
- 35 dichloromethane and the solution washed with saturated aqueous sodium bicarbonate, 5% aqueous citric acid, water and brine. The solution was dried over anhydrous magnesium sulfate, filtered and concentrated in vacuo.

The product thus obtained was recrystallized from a mixture of acetone and hexane.

To a solution of 1 mmol of carboxylic acid in 12 mL of toluene and 3 mmol of triethylamine at 90°C under a nitrogen atmosphere, was added 1 mmol of diphenylphosphoryl azide. After 1 hour, a solution of 1

- mmol of amino alcohol derivative in 3.5 mL of either N,N-dimethylformamide or toluene was added. After 1 hour, the solvent was removed under reduced pressure, ethyl acetate and water added and the layers separated.
- 5 The organic layer was washed with 5% citric acid, sodium bicarbonate, brine, dried, filtered and concentrated to afford the crude product. This was then recrystallized or chromatographed on silica gel to afford the purified final compound.

Example 16A. Preparation of 4(4-methoxybenzyl)itaconate

A 5 L three-necked round bottomed flask equipped with constant pressure addition funnel, reflux condenser, nitrogen inlet, and mechanical stirrer was charged with itaconic anhydride (660.8g, 5.88 mol) and toluene (2300 mL). The solution was warmed to reflux and treated with 4-methoxybenzyl alcohol (812.4g, 5.88 mol) dropwise over a 2.6h period. The solution was maintained at reflux for an additional 1.5h and then the contents were poured into three 2 L erlenmeyer flasks to crystallize. The solution was allowed to cool to room temperature whereupon the desired mono-ester crystallized. The product was isolated by filtration on a Buchner funnel and air dried to give 850.2g, 58% of material with mp 83-85°C, a second crop, 17% was isolated after cooling of the filtrate in an ice bath. ¹H NMR (CDCl₃) 300 MHz 7.32(d, J=8.7 Hz, 2H), 6.91(d, J=8.7 Hz, 2H), 6.49(s, 1H), 5.85(s, 1H), 5.12(s, 2H), 3.83(s, 3H), 3.40(s, 2H).

their calculated IC₅₀ (inhibiting concentration 50%,
i.e., the concentration at which the inhibitor compound
reduces enzyme activity by 50%) values are shown in
25 Table 16. The enzyme method is described below. The
substrate is 2-aminobenzoyl-Ile-Nle-Phe(p-NO₂)-Gln-
ArgNH₂. The positive control is MVT-101 (Miller, M. et

as follows:

30 Assay buffer: 20 mM sodium phosphate, pH 6.4
20% glycerol
1 mM EDTA
1 mM DTT
0.1% CHAPS

35 The above described substrate is dissolved in
DMSO, then diluted 10 fold in assay buffer. Final
substrate concentration in the assay is 80 μM.

-159-

HIV protease is diluted in the assay buffer to a final enzyme concentration of 12.3 nanomolar, based on a molecular weight of 10,780.

The final concentration of DMSO is 14% and the final concentration of glycerol is 18%. The test compound is dissolved in DMSO and diluted in DMSO to 10x the test concentration; 10 μ l of the enzyme preparation is added, the materials mixed and then the mixture is incubated at ambient temperature for 15 minutes. The enzyme reaction is initiated by the addition of 40 μ l of substrate. The increase in fluorescence is monitored at 4 time points (0, 8, 16 and 24 minutes) at ambient temperature. Each assay is carried out in duplicate wells.

Example 47

20 The effectiveness of the compounds listed in Table 9 were determined in the above-described enzyme assay and in a CEM cell assay.

 The HIV inhibition assay method of acutely infected cells is an automated tetrazolium based colorimetric assay essentially that reported by Pauwles et al, J. Virol. Methods 20, 309-321 (1988). Assays were performed in 96-well tissue culture plates. CEM cells, a CD4⁺ cell line, were grown in RPMI-1640 medium (Gibco) supplemented with a 10% fetal calf serum and were then treated with polybrene (2μg/ml). An 80 μl volume of medium containing 1 x 10⁴ cells was dispensed into each well of the tissue culture plate. To each well was added a 100μl volume of test compound dissolved in tissue culture medium (or medium without test compound as a control) to achieve the desired final concentration and the cells were incubated at 37°C for 1 hour. A frozen culture of HIV-1 was diluted in culture medium to a concentration of 5 x 10⁴ TCID₅₀ per ml (TCID₅₀ = the dose of virus that infects 50% of cells in tissue culture), and a 20μL volume of the virus sample (containing 1000 TCID₅₀ of virus) was added to wells containing test compound and to wells containing only medium (infected control cells). Several wells received culture medium without virus (uninfected control cells).

-161-

Likewise, the intrinsic toxicity of the test compound was determined by adding medium without virus to several wells containing test compound. In summary, the tissue culture plates contained the following experiments:

5

	Cells	Drug	Virus
1.	+	-	-
2.	+	+	-
10 3.	+	-	+
4.	+	+	+

In experiments 2 and 4 the final concentrations of test compounds were 1, 10, 100 and 500 $\mu\text{g/ml}$. Either azidothymidine (AZT) or dideoxyinosine (ddI) was included as a positive drug control. Test compounds were dissolved in DMSO and diluted into tissue culture medium so that the final DMSO concentration did not exceed 1.5% in any case. DMSO was added to all control wells at an appropriate concentration.

Following the addition of virus, cells were incubated at 37°C in a humidified, 5% CO₂ atmosphere for 7 days. Test compounds could be added on days 0, 2 and 5 if desired. On day 7, post-infection, the cells in each well were resuspended and a 100 μl sample of each cell suspension was removed for assay. A 20 μL volume of a 5 mg/ml solution of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) was added to each 100 μL cell suspension, and the cells were incubated for 4 hours at 27°C in a 5% CO₂ environment. During this incubation, MTT is metabolically reduced by living cells resulting in the production in the cell of a colored formazan product. To each sample was added 100 μl of 10% sodium dodecylsulfate in 0.01 N HCl to lyse the cells, and samples were incubated overnight. The absorbance at 590 nm was determined for each sample using a Molecular Devices microplate reader. Absorbance values for each

-162-

set of wells is compared to assess viral control infection, uninfected control cell response as well as test compound by cytotoxicity and antiviral efficacy.

dosage form will vary depending upon the host treated and the particular mode of administration.

It will be understood, however, that the specific dose level for any particular patient will
5 depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination, and the severity of the particular disease undergoing
10 therapy.

The compounds of the present invention may be administered orally, parenterally, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically
15 acceptable carriers, adjuvants, and vehicles as desired. Topical administration may also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. The term parenteral as used herein includes subcutaneous injections, intravenous,
20 intramuscular, intrasternal injection, or infusion techniques.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable
25 dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable

-171-

Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable nonirritating excipient such as cocoa butter and polyethylene glycols which are solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose lactose or starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, and sweetening, flavoring, and perfuming agents.

While the compounds of the invention can be administered as the sole active pharmaceutical agent, they can also be used in combination with one or more immunomodulators, antiviral agents or other antiinfective agents. When administered as a combination, the therapeutic agents can be formulated as separate compositions which are given at the same time or different times, or the therapeutic agents can be given as a single composition.

The foregoing is merely illustrative of the invention and is not intended to limit the invention to the disclosed compounds. Variations and changes which are obvious to one skilled in the art are intended to be

-172-

within the scope and nature of the invention which are defined in the appended claims.

The preceding examples can be repeated with similar success by substituting the generically or
5 specifically described reactants and/or operating conditions of this invention for those used in the preceding examples.

From the foregoing description, one skilled in the art can easily ascertain the essential
10 characteristics of this invention, and without departing from the spirit and scope thereof, can make various changes and modifications of the invention to adapt it to various usages and conditions.

V. ☒ OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claim numbers ** because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 62-71, 123-127, 182-186 are directed to a method of treatment of the human /animal body, the search has been carried out and based on the alleged effects of the compounds

2. ☐ Claim numbers because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claim numbers because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this International application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the international application
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ supplemental sheet(2)

**** Claims searched incompletely: 1-186**

The use of terms such as heteroaryl and heterocyclyl are in contradiction to the requirements of Art. 6 PCT. The search was performed on the basis of those claims which are clear and concise and of those examples in the description which are complete and correct.
